### CONSUMER PRICE INDEX--SEPTEMBER 1991

The Consumer Price Index for All Urban Consumers (CPI-U) rose 0.4 percent before seasonal adjustment in September to a level of 137.2 (1982-84-100), the Bureau of Labor Statistics of the U.S. Department of Labor reported today. For the 12-month period ended in September, the CPI-U increased 3.4 percent.

The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) also rose 0.4 percent in faptember prior to seasonal adjustment. The September 1991 CPI-W level of 135.2 was 3.1 percent higher than the index in September 1990.

### CPI for All Urban Consumers (CPI-U)

On a seasonally adjusted basis, the CPI-U rose 0.4 percent in September. This compares with increases of 0.2 percent in each of the 3 preceding months and was the largest monthly advance since a similar rise in January. The acceleration between August and September principally reflects advances in the indexes for food, energy, and shelter. The food index rose 0.1 percent in September, largely as a result of the turnaround in the index for fruits and vegetables. The 1.0 percent rise in the energy component, only the second advance this year, reflects an upturn in the indexes for gas and electricity coupled with a larger monthly increase in petroleum-based energy goods. Excluding food and energy, the CPI-U rose 0.4 percent in September, the same as in each of the 3 preceding months. Within this group, a larger increase in shelter costs was essentially offset by the downturn in the index for apparel and upkeep after seasonal adjustment.

| services                         | .7   | . 8   | .2     | . 8                               | .3                             | . 9  | .7   | 8.2      | 8.1      |

Consumer prices rose at a seasonally adjusted annual rate (SAAR) of 3.3 percent in the third quarter of 1991, following increases of 2.4 and 3.0 percent in the first and second quarters, respectively. This brought the year-to-date annual rate to 2.9 percent; during the first 9 months of 1990, the CPI-U increased at a 6.6 percent annual rate. While all three groups-food, energy, and all items less food and energy-moved at a slower pace in the first 9 months of 1991 than in 1990, the sharp drop in energy, particularly petroleum-based energy, has contributed the most to this moderation. Following an advance of 35.4 percent in 1990, petroleum-based energy prices have declined at a 21.8 percent rate in the first 9 months of 1991. The other part of the energy component--natural gas and electricity-rose at a 2.2 percent rate thus far in 1991 after increasing 1.5 percent in 1990.

The index for food has slowed significantly in 1991, advancing at a 1.4 percent rate during the first 9 months. If maintained, this would be the smallest increase in this component since 1976. All major food groups show generally moderate movement this year. Prices for meats and dairy products are lower than at 1990 year-end; and the third-quarter drop in fruit and vegetable prices has nearly offset their sharp increases during the first 6 months of the year. The index for all items less food and energy has advanced at a 4.8 percent rate thus far in 1991, compared with a 5.2 percent increase last year. While the cost of shelter and medical care slowed noticeably, most other components in this group showed little deceleration.

The food and beverage index rose 0.1 percent in September. Grocery store food prices also rose 0.1 percent in September after registering declines in each of the 2 preceding months. The fresh fruit and vegetable price index which had been primarily responsible for the grocery store food declines in July and August, rose 1.4 percent in September. Within this group, prices for fresh fruits rose 3.1 percent, while those for fresh vegetables fell 0.8 percent. A 0.5 percent drop in the index for meats, poultry, fish, and eggs helped to partially offset increases in other grocery store food components. Declines in prices for beef, poultry, and eggs more than offset increases in those for pork and fish and seafood. The index for dairy products registered its third consecutive monthly increase in September, advancing 0.6 percent. The other two major grocery store food groups—cereal and bakery products and other food at home—were unchanged and rose 0.1 percent, respectively. The indexes for restaurant meals and alcoholic beverages increased 0.1 and 0.4 percent, respectively.

The housing component, which was unchanged in August, rose 0.5 percent in September. All three major housing groups contributed to the housing increase. Shelter costs advanced 0.5 percent in September, following a 0.1 percent increase in August. Within shelter, renters' costs and homeowners' costs each rose 0.5 percent, more than offsetting a 0.3 percent decline in maintenance and repair costs. The index for household fuels and utilities turned up in September, increasing 0.6 percent. Fuel oil prices rose 1.7 percent, and charges for natural gas and electricity increased 1.4 and 0.7 percent, respectively. The index for household furnishings and operations rose 0.2 percent in September, following a decline of 0.1 percent in August.

Transportation costs rose 0.2 percent in September, with about twothirds of the advance attributable to a 0.9 percent increase in prices for
motor fuels. Despite increases in each of the past 2 months, gasoline
prices remain well below their peak level. As of September, they were 17.1
percent lower than in November 1990. New car purchase costs showed a small
increase in September; new car prices rose 0.3 percent, while automobile
finance charges fell 0.5 percent. The index for used cars declined 0.2
percent. Public transportation costs declined 0.7 percent in September as a
1.4 percent decrease in airline fares more than offset increases in other
intercity and intracity public transportation.

The index for apparel and upkeep fell 0.4 percent in September, following substantial increases in each of the 2 preceding months. The September clothing price increases were smaller than usual--up 3.1 percent before seasonal adjustment--as a result of the introduction of this year's fall-winter wear in July and August.

The medical care component rose 0.7 percent in September--to a level 8.4 percent above a year ago. The index for medical care commodities rose 0.6 percent, largely due to an increase of 0.9 percent in the index for prescription drugs. The index for medical services advanced 0.7 percent, with the cost of professional services and hospital and related services up 0.7 and 0.3 percent, respectively.

Entertainment costs rose 0.7 percent in September, following a 0.4 percent rise in August. Increases in the indexes for sporting goods and equipment and fees for participant sports, up 1.9 and 2.4 percent, respectively—accounted for over one-half of the entertainment advance.

The index for other goods and services rose 0.7 percent in September. Virtually all of the increase in this major group was accounted for by advances in the indexes for tuition and other school fees and tobacco and smoking products—up 1.2 and 1.3 percent, respectively.

### CPI for Urban Wage Earners and Clerical Workers (CPI-W)

On a seasonally adjusted basis, the CPI for Urban Wage Earners and Clerical Workers rose 0.4 percent in September.

Table B. Percent changes in CPI for Urban Wage Earners and Clerical Workers (CPI-W)

Consumer Price Index data for October 1991 will be released on Thursday, November 14, 1991, 8:30 A.M. (EST).

### A Note on Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted changes are usually preferred since they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year—such as price movements resulting from changing climatic conditions, production cycles, model changeovers, holidays, and sales.

The unadjusted data are of primary interest to consumers concerned about the prices they actually pay. Unadjusted data also are used extensively for escalation purposes. Many collective bargaining contract agreements and pension plans, for example, tie compensation changes to the Consumer Price Index unadjusted for seasonal variation.

Seasonal factors used in computing the seasonally adjusted indexes are derived by the X-11-ARIMA Seasonal Adjustment Method. The updated seasonal data at the end of 1977 replaced data from 1967 through 1977. Subsequent annual updates have replaced 5 years of seasonal data, e.g., data from 1986 through 1990 were replaced at the end of 1990. The seasonal movement of all items and 47 other aggregations is derived by combining the seasonal movement of 60 selected components. Each year the seasonal status of every series is reevaluated based upon certain statistical criteria. If any of the 60 components change their seasonal adjustment status from seasonally adjusted to not seasonally adjusted, not seasonally adjusted data will be used for the last 5 years, but the seasonally adjusted indexes will be used before that period.

Effective with the calculation of the seasonal factors for 1990, the Bureau of Labor Statistics has used an enhanced seasonal adjustment procedure called intervention analysis for some CPI series. Intervention analysis allows for better estimates of seasonally adjusted data. Extreme values and/or sharp movements which might distort the seasonal pattern are removed from the data prior to calculation of seasonal factors. For the fuel oil and the motor fuels indexes, this procedure was used to offset the effects that extreme price volatility would otherwise have had on the estimates of seasonally adjusted data for those series. For some women's apparel indexes and the girls' apparel index, the procedure was used to offset the effects of changes in pricing methodology; and for new cars, new trucks, and new vehicles, this procedure was used to offset the effects of changes in marketing strategies and the introduction of new models. For the tobacco and smoking products index, this procedure was used to offset the effects of increases in excise taxes and wholesale tobacco prices. A description of intervention analysis, as well as a list of events treated as interventions and seasonal factors for these items may be obtained by writing the Bureau of Labor Statistics, Division of Consumer Prices and Price Indexes, Washington, DC 20212 or by calling Claire McAnaw on (202)504-2051.

### Brief Explanation of the CPI

The Consumer Price Index (CPI) is a measure of the average change in prices over time in a fixed market basket of goods and services. The Bureau of Labor Statistics publishes CPIs for two population groups: (1) a CPI for All Urban Consumers (CPI-U) which covers approximately 80 percent of the total population and (2) a CPI for Urban Wage Earners and Clerical Workers (CPI-W) which covers 32 percent of the total population. The CPI-U includes, in addition to wage earners and clerical workers, groups such as professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, and retirees and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, and fuels, transportation fares, charges for doctors' and dentists' services, drugs, and the other goods and services that people buy for day-to-day living. Prices are collected in 85 urban areas across the country from about 57,000 housing units and approximately 19,000 retail establishments-department stores, supermarkets, hospitals, filling stations, and other types of stores and service establishments. All taxes directly associated with the purchase and use of items are included in the index. Prices of food, fuels and a few other items are obtained every month in all 85 locations. Prices of most other commodities and services are collected every month in the five largest geographic areas and every other month in other areas. Prices of most goods and services are obtained by personal visits of the Bureau's trained representatives. Mail questionnaires are used to obtain public utility rates, some fuel prices, and certain other items.

In calculating the index, price changes for the various items in each location are averaged together with weights which represent their importance in the spending of the appropriate population group. Local data are then combined to obtain a U.S. city average. Separate indexes are also published by size of city, by region of the country, for cross-classifications of regions and population-size classes, and for 29 local areas. Area indexes do not measure differences in the level of prices among cities, they only measure the average change in prices for each area since the base period.

The index measures price change from a designated reference date--1982-84 which equals 100.0. An increase of 16.5 percent, for example, is shown as 116.5. This change can also be expressed in dollars as follows: the price of a base period "market basket" of goods and services in the CPI has risen from \$10 in 1982-84 to \$11.65.

For further details see BLS Handbook of Methods, Chapter 19, the Consumer Price Index, Bulletin 2285, April 1988.

## Calculating Index Changes

13

15

Movements of the indexes from one month to another are usually expressed as percent changes rather than changes in index points, because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The example in the accompanying box illustrates the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates and are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

N - Every month.
1 - January, March, May, July, September, and November.
2 - February, April, June, August, October, and December.
Ragions are defined as the four Census regions.
Indexes on a December 1986-100 base.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size than the national index and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater velatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses.

<sup>11</sup> 

Toods, fuels, and several other items priced every month is ail areas; most other goods and services priced as indicated;

N - Every month.

1 - January, March, May: July, September, and Boyember.

2 - February, April, June, August, October, and Boyember.

Regions are defined as the fopy Cessus regions.

Indexes on a December 1981-100 base.

Data not available.

Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller happing of the national index and in, therefore, subject to substantially more amplied and other memory and of the resource of the result, local area indexes above greater volatility than the national index and other memory is result. Incert are indexed above greater volatility than the national index, although their long-term irresp are similar. Therefore, the Bureau of Labor Statistics atrengly urges users to consider adopting the national every CPI for use in their escalator clauses.
